WordPress

An Image Guided Surgical System With Unprecedented Benefits

With the 7D Surgical System for both spine and cranial navigation, surgeons are empowered with a cost-effective, rapid, radiation-free alternative to traditional image guided surgery (IGS).

MACHINE VISION

The vision is clear

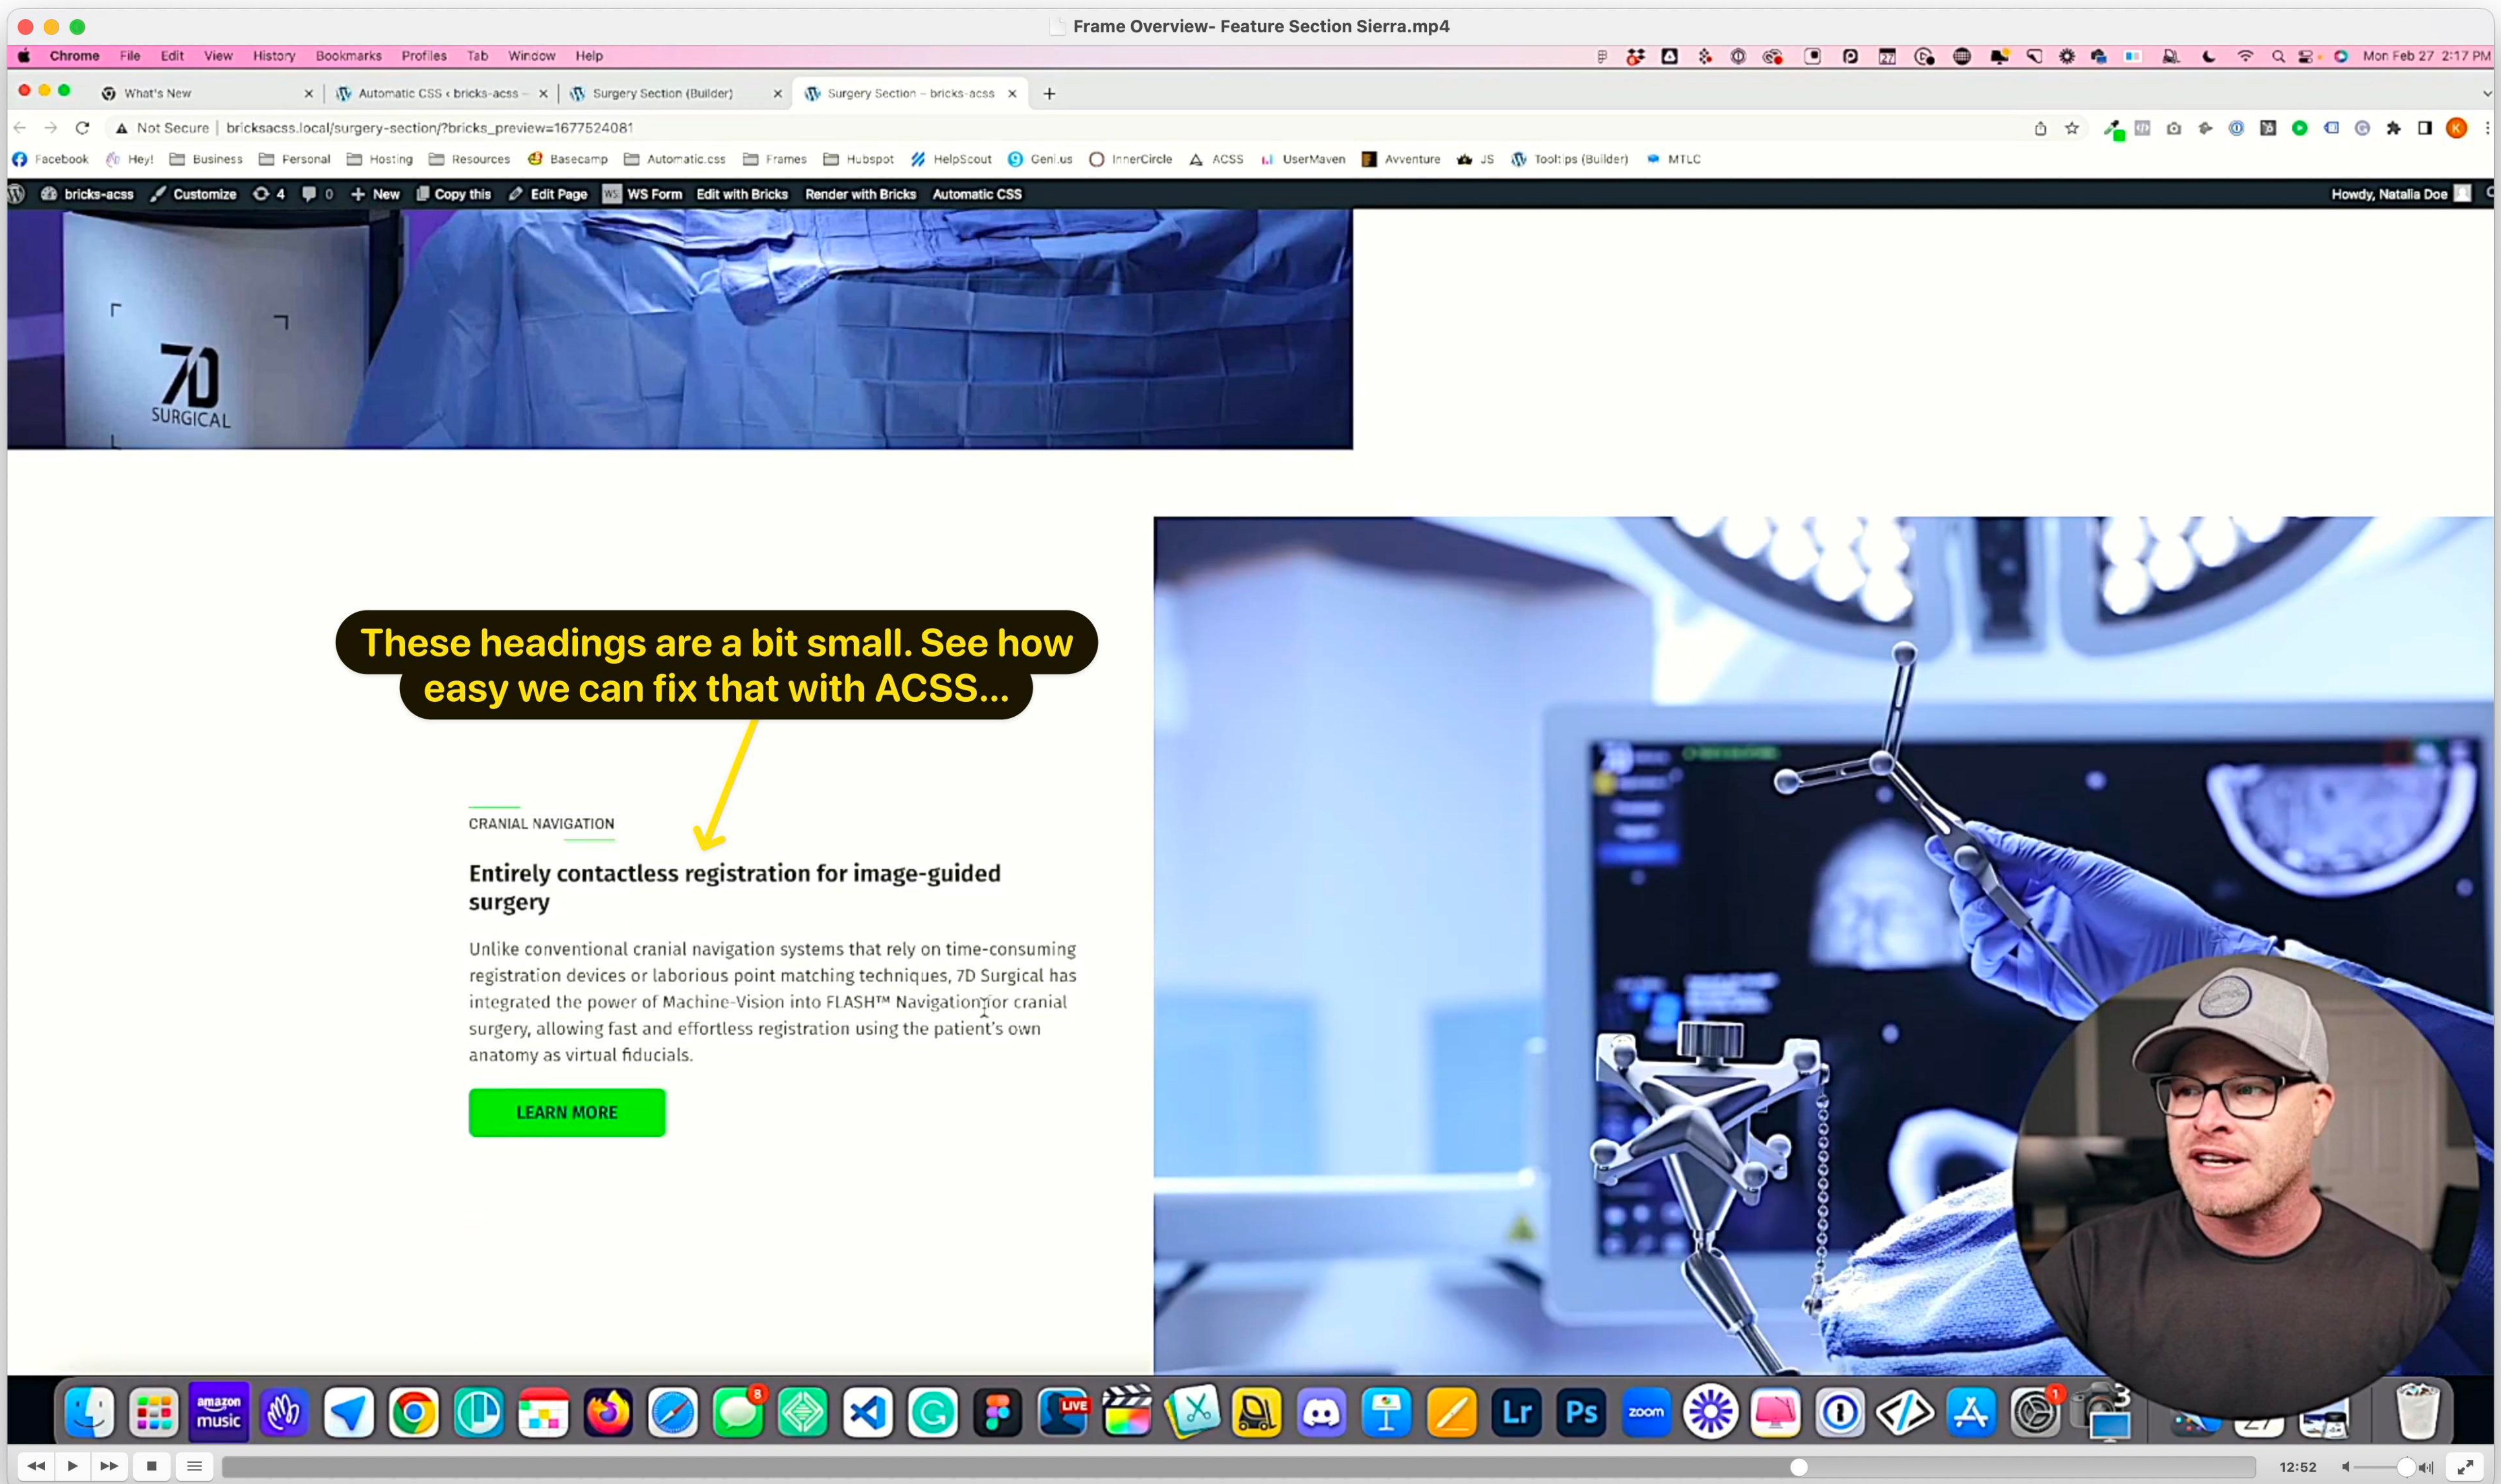

7D Surgical's Machine-Vision technology is similar to that of self-driving cars. It utilizes special cameras to analyze surface anatomy in just seconds using only visible light. This creates a full-color 3D image reconstruction consisting of hundreds of thousands of data points used for surgical navigation.

Machine-vision technology allows for the fastest image reconstruction for surgical navigation all through the flash of a light.

LEARN MORE

These headings are a bit small. See how easy we can fix that with ACSS...

CRANIAL NAVIGATION

Entirely contactless registration for image-guided surgery

Unlike conventional cranial navigation systems that rely on time-consuming registration devices or laborious point matching techniques, 7D Surgical has integrated the power of Machine-Vision into FLASH™ Navigation for cranial surgery, allowing fast and effortless registration using the patient's own anatomy as virtual fiducials.

LEARN MORE

Don't change to H2 because it's semantically wrong! These are not H2t

With the 7D Surgical System for both spine and cranial navigation, surgeons are empowered with a cost-effective, rapid, radiation-free alternative to traditional image guided surgery (IGS).
